3R principles as an approach to designing NAMAs on the municipal solid waste sector: opportunities and challenges

> Janya Sang-Arun Nirmala Menikpura

Sustainable Consumption and Production Group Institute for Global Environmental Strategies

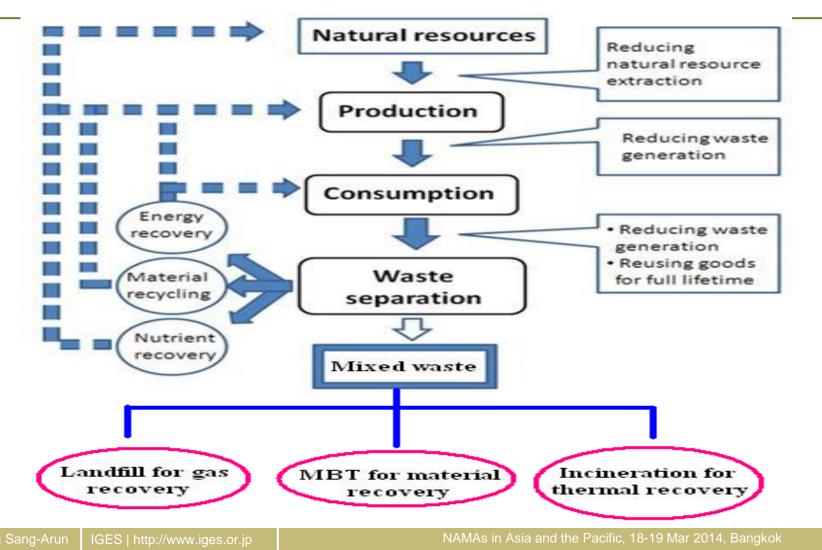

GHG emissions from solid waste management

According to IPCC guidelines, GHG emissions related to solid waste management can be categorised into different groups

| Source of GHG emission | Categorised under waste sector | Categorised under non- waste sector |
|--|--------------------------------------|---|
| CH₄ emission from landfills/open dumping, composting of organic waste CH₄ emission from incineration and open burning (minor) | \star | |
| CO₂ emission from incineration without energy recovery and open burning CO₂ emission from incineration with energy recovery | * | * |
| N₂O emission from combustion and composting | \star | |
| • GHG emission from utilisation of fossil fuel for waste transportation, operational activities and grid electricity consumption for operational activities and recycling | | * |
| GHG emission from manure and farm waste management | | \star |

The 3Rs for sustainable waste management, climate change mitigation and enhance resource efficiency

Climate co-benefits of 3Rs in various sectors

| Sectors | Climate co-benefits |
|------------------------------|--|
| Sectors | Climate CO-benefits |
| Waste | Reduced methane emissions from landfill Reduced carbon dioxide emissions from burning of plastics |
| Energy and transport | Reduced emissions from energy use in the process of resource extraction, agriculture, good production and distribution, and waste transportation and treatment Reduced emissions from fossil fuels by using energy recovered from waste |
| Industry | Reduced emissions from industrial processes by reducing product demand Reduced emissions from chemical fertilizer production |
| Agriculture | Avoided nitrous oxide emissions from farmland by reducing use of chemical fertilizer Increased soil carbon sequestration |
| Land use change and forestry | - Reduced emissions from mining and deforestation |

GHG emissions reduction through improved MSW in Thailand

- Life cycle approach used as a tool for evaluation
 - Waste sector \rightarrow Methane from open dumping and landfill

 \rightarrow Carbon dioxide from incineration

- Energy sector \rightarrow Fuel, incineration (electricity generation)
- Industrial sector \rightarrow Production
- Agriculture sector \rightarrow Chemical fertiliser use
- Compared the emission reduction with conventional sanitary landfill (without gas recovery)

IGES-SCP 3Rs for NAMAs

GHG emission on the waste sector of SWM in Thailand- not LCA

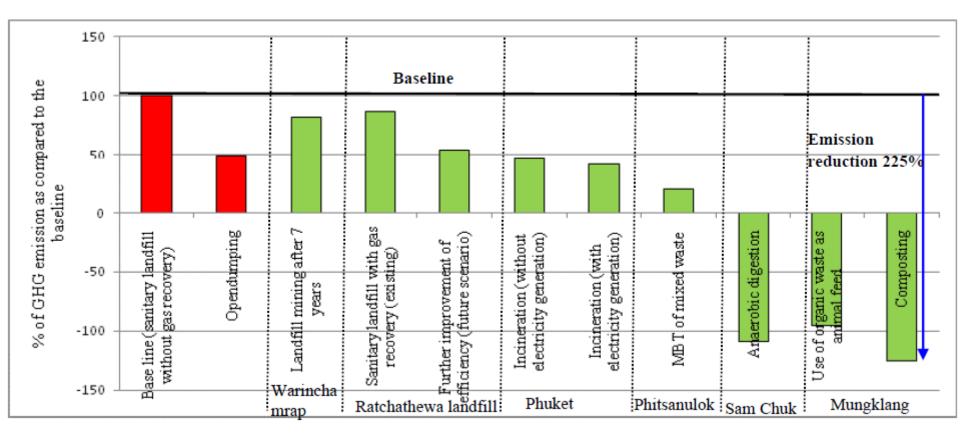

Baseline for mixed waste management is sanitary landfilling of mixed waste without gas recovery.

The baseline of organic waste utilisation is sanitary landfilling of organic waste without gas recovery

GHG emissions from SWM in Thailand- LCA perspective

Baseline for mixed waste management is sanitary landfilling of mixed waste without gas recovery.

The baseline of organic waste utilisation is sanitary landfilling of organic waste without gas recovery

GHG emissions from material recycling in Thailand- LCA perspective

| Type of recyclables | GHG emissions from recycling ¹ (A) | | GHG emissions avoidance from sanitary landfill (C) | Net emissions from recycling (D) = (A)-(B)-(C) |
|------------------------|---|--------------------------------|---|--|
| | | Unit : (tCO ₂ -eq/t | conne of waste) | |
| Paper | 1.27 | 0.97 | 2.38 | -2.08 |
| Plastic | 2.15 | 1.90 | 0 | 0.25 |
| Aluminium | 0.39 | 12.47 | 0 | -12.08 |
| Steel | 1.10 | 2.95 | 0 | -1.85 |
| Glass | 0.57 | 1.03 | 0 | -0.46 |

Best practice on SWM and climate change mitigation in Thailand: Phitsanulok Municipality

- Public participation → Community based management
 - Residents separated recyclables for sale
 - Residents conduct household and community organic waste management
 - Composting, anaerobic digestion, animal feed
 - Municipality applies the Mechanical Biological Treatment (MBT) prior to landfill disposal
 - Municipality uses of NGV to minimise cost of fuel consumption
 - Municipality introduces the Polluter Pay Principle

IGES-SCP 3Rs for NAMAs

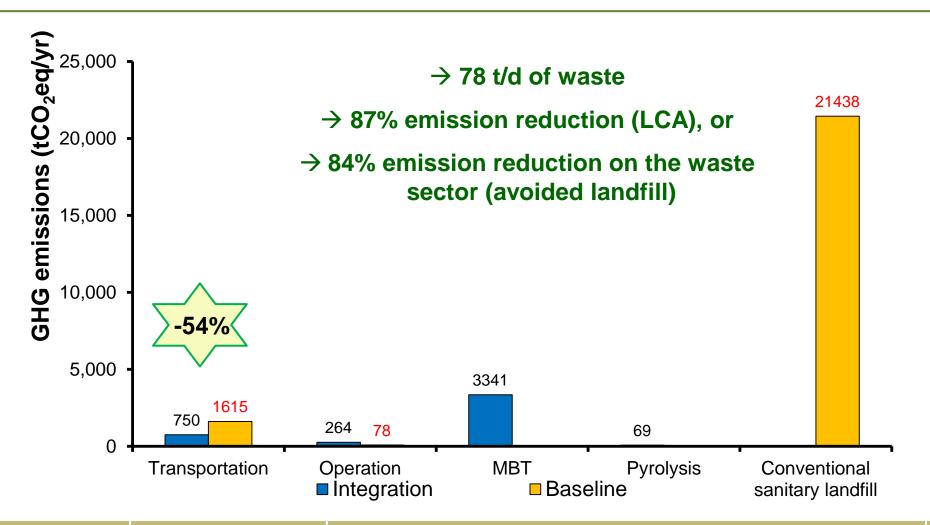

Flowchart of solid waste management in Phitsanulok **Municipality**

Summary of GHG emissions from integrated waste management system in Phitsanulok Municipality

GHG emissions from material recycling (rough estimation)

| Recyclables | Weight (t/d) | GHG emissions per tonne (tCO ₂ eq) | Total emissions (tCO ₂ eq/d) |
|-------------|-----------------|--|--|
| Paper | 8.7 | -2.08 | -18.0 |
| Plastic | 5.4 | 0.25 | 1.4 |
| Aluminium | 1.4 | -12.08 | -17.4 |
| Steel | 5.0 | -1.85 | -9.3 |
| Glass | 15.5 | -0.46 | -7.1 |
| Net | 36 | | -50.5 |

Phitsanulok Municipality contributes to avoidance 50.5 tCO2eq/day when compare with non-recycling

If this emission is included, the Municipality can achieve zero GHG emissions (LCA).

Note: Suchada et al., (2003), approximate composition of collected recyclables by various participants in the municipality is 24% paper, 15% plastic, 43% glass, 4% aluminum and 14% steel.

The 3Rs policies in developing Asian countries

- Improved solid waste management policy
 - National 3R strategies, integrated solid waste management
 - Philippines, Malaysia, Viet Nam, China, Cambodia, Bangladesh, Indonesia, Thailand, etc.
- Climate change mitigation action policy
 - Avoiding GHG emission from the waste sector
 - China, India, Indonesia, Thailand and the Philippines, etc

IGES-SCP 3Rs for NAMAs

Opportunities

- Existing of national 3R policies in many countries
- Existing of 3R practices by local governments
- Existing of various 3R technologies in countries
- Local governments can choose technologies and scale of implementation based on the local context
- Contribution to national agenda on food security, energy security, poverty reduction, etc.
- GHG calculation tool for local governments is existed and publicly downloadable through IGES website

Challenges

- Difficult to directly quantify GHG emission reduction from reduction and reusing
- Local governments has limited capacity on data collection and quantification of GHG emission reduction
 - \rightarrow Should provide training to local governments
- How to measure, report and verify from local to national levels
 → Should develop national framework for MRV
- Financial accessibility and incentives

 \rightarrow Should set up a financial scheme or crediting system for NAMAs implementation

IGES capacity building supports

- Awareness raising on waste management and climate change
- GHG calculation tool in local language
- Training on GHG quantification
- Guideline on promoting organic waste utilization for climate change mitigation
- Facilitating city-to-city cooperation (North-South-South) for reducing GHG emission reduction from solid waste management

MBT

IGES pilot project on MRV of composting projects

- Battambang City, Cambodia and Phitsanulok Municipality, Thailand
- Participatory pilot project implementation on organic waste separation at source for composting for GHG emission reduction
- Measuring and reporting by local government and verifying by IGES

Recommendations

- 3Rs (reduce, reuse, recycle) is a climate friendly waste management policy that should be adopted Nationally Appropriate Mitigation Actions (NAMAs) to strengthening its implementation for national waste management plan, etc.
- Some municipalities practice 3Rs for minimising the waste to final disposal site, however most municipalities do not understand the linkage of the 3Rs and global warming. Therefore, capacity building and awareness raising are important to achieve the GHG emission reduction goal of the NAMAs.
- In addition, subsidies to landfill development should be minimised, unless the 3Rs is integrated to the project.
